

Week 2 Assignment

Overview

In this assignment, you will create a new Next.js project. You will create a new page for week-2 and a React component. You will also edit the root page of the project.

The Next.js project that you create here will be used for all of the assignments in this course. You will add new weekly folders to the project for each assignment.

Prerequisites

If you did not complete Week 1 Assignment, complete the Guide: [Setting Up Your Development Environment](#).

Part 1: Create a New Next.js Project

Follow the [Guide: Creating a New Next.js Project](#) to create a new Next.js project. The project name and GitHub repository name must be cprg306-assignments.

Failure to name the project and repository correctly will result in a 0 for all assignments.

Part 2: Create a New Page for week-2, a React Component, and Edit the Root Page

- **Create week-2 Page**

In the project app folder, create a new **folder** called week-2.

In the week-2 folder, create a new **file** called page.js.

In the week-2/page.js file, enter the following code to display a heading:

```
export default function Page() {  
  return (  
    <main>  
      <h1>Shopping List</h1>  
    </main>  
  );  
}
```

Try out the new page! In the browser, navigate to <http://localhost:3000/week-2>. You should see the heading displayed. Don't worry about the styling for now.

- **Create StudentInfo Component**

In the week-2 folder, create a file called student-info.js.

In the student-info.js file, code a React component called StudentInfo that renders (displays) the following information:

- Your name
- A link to your GitHub repository

You should use `Link` component from Next.js to link to your GitHub repository. Do not use the HTML anchor tag directly.

The component should be exported as the default export.

- **Render StudentInfo in week-2 Page**

In the week-2/page.js file, import the StudentInfo component you created in the previous step.

Render (display) the StudentInfo component below the heading tag.

After every change, you should view the page in the browser to make sure it is working as expected. You should see the heading and your name and GitHub link displayed.

- **Edit Root Page**

The root page is the page that is displayed when you navigate to `http://localhost:3000/`. It is the page.js file in the project /app folder.

Edit the root page and remove all of the code. You will replace it with new code.

The root page should contain the following:

- The heading: CPRG 306: Web Development 2 - Assignments
- A link to the week-2 page you created above

- **Additional information**

The [Guide: Coding Workflow](#) may help you with the coding workflow.

There is no requirement to deploy the application, but you may do so if you wish.

See [Guide: Deploying a Next.js Application](#) for instructions.

- **Example Output: Review**

Root Page: <https://cprg306-assignments-seven-sepia.vercel.app/>

Week 2 page: <https://cprg306-assignments-seven-sepia.vercel.app/week-2>

Part 3: Deploy to Vercel

Deploy your application to Vercel by following the guide "Deploying a Next.js App." Ensure your live deployment is accessible via a public URL.

Part 4: Assignment Submission

Please submit the following two links for your project submission on Brightspace:

1. **GitHub Repository URL:** The web address for your source code repository on GitHub.
2. **Vercel Deployment URL:** The public, live URL where your application is hosted and running.

Ensure the following:

- You have completed the previous assignment.
- The GitHub repository is **public** and named exactly cprg306-assignments.
- The weekly folder is named exactly week-2 (lowercase) and contains the page.js file.
- You have committed and pushed your changes to GitHub before the assignment deadline.
